IF DISAGREE, WHY?

OTHER COMMENTS:

Site Status: Active
Site Description: Formerly a holding station for gasoline and Kerosene, 1928-1958, owned and operated by the Standard Oil Company. In 1958 the NJDOT purchased the land specifying that all tanks and equipment be removed. Four (4) 10,000 gallon above ground tanks were cleaned out and a lead sludge precipitate was collected. The sludge was buried on site in a 90 x 180' area. In 1959 NJDOT removed the sludge to the point where the soil was visibly clean. In 1980 sampling of a public well, 150' from site, and a private well, 500' from site, revealed lead below detectable limits. Potential for ground and surface water exists. Groundwater is used as a drinking water source by residents in the area (private wells)

RECOMMENDATION:

FINAL (BY EPA) Low priority. A site inspection should be conducted on a time available basis as no post-clean up sampling was undertaken to confirm the removal of all contaminated soil.
